Proyecto #3
Simulador CPU
Carlos Gomes Osa, 2016121385
Jeremy Live González, 2015068507

Abstract:

On this project we introduce you on the process of operation with matrix. We applicant the distributed processing, parallelism, time-sharing and concurrency and we implement correctly apply high-level programming language instructions that make use of tools to complement concurrency and parallelism such as the use of threads (threads) among others to provide an adequate response to the problems highlighted.

Pasos a seguir, para poder ejecutar el código :

- 1- Se debe de introducir las matrices con las que se quieres trabajar, se pueden hasta n. La aplicación es introducirlas en una pila.
- 2- Se introduce la operación matricial que se quiere efectuar y lo siguiente que hace el programa es hacer 2 pop de la PILA(FIFO) y operar dichas matrices en base a los hilos(Threads) que el usuario digita previamente.
- 3- En Base a los hilos(Threads) se divide el problema que se efectuara.
- 4- Se podrá navegar en la matriz resultante con 4 botones integrados.
- 5- El usuario puede ingresar y/o modificar los parámetros del programa en cada iteración.
- 6- Interfaz muy interactiva para el usuario ©

✓ Introducción :

En este proyecto programado de Matrices se trabajó en el lenguaje de alto nivel C++ y en lenguaje de bajo nivel NASM.

Se desarrolló un programa que permite al usuario aplicar operaciones entre matrices. Estas operaciones a implementar son: Suma de matrices, Producto de un escalar por una matriz, Producto de matrices, Matriz Inversa, Calculo de la transpuesta de una matriz.

Para cada matriz resultante se indica si el tipo de la misma es: matriz fila, matriz columna, matriz rectangular, matriz cuadrada, matriz nula, Triangular superior, Triangular inferior, matriz diagonal, matriz escalar, matriz identidad o unidad.

Se utilizó una LIGA para poder ejecutar en él .cpp archivos .asm, esto para lograr que el programa en alto nivel solamente colecte los datos, los transmite al programa NASM y con el resultado desde NASM desplegarlos al usuario. Se escogió la operación ESCALAR POR MATRIZ para ser implementada completamente en NASM.

✓ Desarrollo:

Lógica para efectuar las operaciones entre matrices en base a los hilos que digito el usuario. Se decidió hacerse del siguiente modo:

- 1 Para el caso de multiplicación de matrices se hace lo siguiente:
- 1: Se divide el hilo equitativamente. En cada hilo se agarra una fila(matriz1) y una columna(matriz2) se hace las operaciones y se escribe en un archivo con el hilo para escribir.
- 2: Esto disminuye el tiempo en la creación del archivo y la aritmética de operaciones
- 2 Para el caso de suma de matrices se hace lo siguiente:
- 1: Se divide el hilo equitativamente. En cada hilo se agarra una fila(matriz1) y una fila(matriz2) se hace la suma con respecto a su índice.
 - 2: Se escribe en un archivo con el hilo para escribir.
- 3 Para el caso de escalar se efectúa en un hilo el escalar y en el otro se va cambiando las fila de la matriz.
- 4 En el caso de verificar que matriz es, se hace en alto nivel.

✓ Análisis:

Los hilos funcionan de la siguiente forma:

- 1 Existe un hilo lector el cual reparte el trabajo. Por ejemplo si el usuario digita 4 hilos el lector le reparte a los cuatro tan equitativamente como puede.
- 2 Existe también un hilo escritor, que recibe los resultados de los hilos que hacen operaciones, y lo escribe en el documento resultante.

La LIGA entre C++ y NASM se efectuó de la siguiente forma:

1 - En el archivo "Matriz.pro" se debe de poner la línea

```
mul_es.asm
```

Ósea esto para que pueda compilar el IDE QT con el .asm

```
FORMS += mainwindow.ui

72

73  QMAKE_EXTRA_COMPILERS += nasm

74  NASMEXTRAFLAGS = -f elf64 -g -F dwarf

75  OTHER_FILES += $$NASM_SOURCES

76  nasm.output = ${QMAKE_FILE_BASE}.o

77  nasm.commands = nasm $$NASMEXTRAFLAGS -o ${QMAKE_FILE_BASE}.o ${QMAKE_FILE_NAME}

78  nasm.input = NASM_SOURCES

79

80  NASM_SOURCES += mul_es.asm

81

82  DISTFILES += \

83  mul_es.asm

64

65  st_prop.h \

66  t_verificar.h
```

2 – En el archivo "Mul_es.asm" se realizó la operación de producto escalar por matriz:

```
global mul es
                 ;Nombre que tendrá la funcion
                  ;tambien en C++
                                                                  ٧
bits 64
                  ;64 bits
section .text
mul es:
   push rbp
                  ;FIFO
  mov rbp, rsp ; Para usar parametros por la pila
               ;FIFO
   push rbx
                 ;FIFO
   push rex
                 ;FIFO
   push rdx
   push rdi
                 ;FIFO
   mov rbx, rax
                 ;Registros a usar
    mov rdi, rdx
        ;loop principal
lp:
    mov eax,[rdi] ;Corrida del puntero, para conseguir el dato
        ;con el cual se trabajará
ebx ;Realizo la multiplicacion
    mul ebx
    mov [rdi], eax ; Muevo el resultado de la multiplicacion
              ;al espacio de memoria inicial de rdi
    add rdi,4
                  ;le agrego al rdi el size de un int
    loop lp
            ;Condicion del loop
   pop rdi
                 ;FIFO
                  ;FIFO
    pop rdx
                  ;FIFO
    pop rex
    pop rbx
                  ;FIFO
                 ;FIFO
    pop rbp
                  ;Regreso donde fue llamada la funcion mul es.asm
    ret
```

✓ Conclusión :

En este tercer proyecto programa se aprendió a trabajar con hilos en alto nivel y a conectar C++ con NASM por medio de una liga.

Se aprendió a trabajar en equipo.

Fue complementario programar este proyecto.

Muy didáctico.

✓ Apéndices :
